Peculiarities in the Development of Trap-Magmatism 50V/20-123-2-36/50, in the Northwestern Siberian Platform

later flows became more and more basic. From this, one can assume that light differentiation products collected near the top of the magma chamber while the heavier products sank. Towards the end of a cycle magma rich in the volatile constituents was yielded up from a deeper part of the chamber, Thus the magnesium-rich traps of the Noril'skiy type and the platinum and nickel enriched intrusions of Noril'skiy evidence the tapping of deeper reservoirs which were related to regional fault zones. (Ref 6). That crystallization-differentiation was dominant is shown by the formation of traps in the intrusive facies; naturally, differentiation is also evidenced in some lava flows, i.e. the picrite porphyries. The relative number of intrusions increased with every cycle; the most highly differentiated intrusions with the greatest amounts of volatile elements appeared at the end of every cycle. In the Siberian Plateau, the many exploitable mineral resources are genetically or paragenetically related to trap-intrusions of this sort. There are 1 figure and 6 Soviet references.

Automatic Inter-City Telephone Communications, Mos-

cow-Leningrad

PERIODICAL:

Vestnik svyazi, 1959, Nr 8, pp 4-5 (USER)

ABSTRACT:

The article deals briefly with an experimental automatic set-up for inter-city telephone communication between Moscow and Deningrad, which has been in service since 1 July, 1959. The equipment was developed at the TsNIIS, and manufactured and installed by the TsMTS. This set-up gives all subscribers of the Moscow ATS B-9 direct distance dualing to any subscriber in Leningrad. The equipment was also in operation during the 21st Party Congress in February, 1959 for communication by the delegates with a number of Soviet cities: Leningrad, Kiyev, Tallin, Vil'nyus, Che-lyabinsk, Penza, Kuybyshev, Ryazan', Sverdlovsk, Kalinin, Saratov, and Tula. This experimental set-up will be used to study several problems connected

Card 1/3

Autometic Inter-City Telephone Communications, Moscow-Leningrad

with automatic distance dialing in practice, particularly in connection with the system of accounting and billing, and to study "the necessity of introducing limitations on the use of automatic inter-city telephone communications", as well as the nature of the inter-city call load, and technical and economical factors. The experience thus gained will be used in the development of standard apparatus for automatic inter-city telephone communications presently underway. A skeleton diagram of the apparatus and its operation is described (Fig 1). Provided for in this set-up is equipment for determining the caller's number automatically which is described in patent Nr 109992 (27 Nov 1957), issued to V.A. Godlevskiy and S.A. Vasil'yev, collaborators of the TsNIIS, and L.M. Gol'dshteyn, M.F. Lutov and O.A. Sobolev, collaborators of MII gosudarstyonnogo komiteta seveta ministrov SSSR (NII of the State Committee of the Council of Ministers of the USSR) on electronics. forated tape at the inter-city telephone station (MTS). The author describes the presently used system in which the caller duals his own number as well as the desired one to provide the receivery information on the call, all of which, including date integration of the call is stored on a perferated type (Fig 2). Development of the appar this was lone by M.L. Vorontsova and F.S. Horkwahev, Engineers of Tenlis, under the direction and with the participation of the author. Setting up of the equipment was organized by P.T. Gobets, Chief Saginder at the Tenlis. There is I diagram and I illustration.

TITLE: Nutritional value of army bread

SOURCE: Lekarz wojskowy, no. 7, 1966, 596-601

TOPIC TAGS: food, food chemistry, vitamin, armed force supply

ABSTRACT: The problem of the nutritional value of the various kinds of bread used in the Polish Armed Forces is discussed in this article. Three main categories are considered: 1) rye breads, 2) wheat breads, and 3) mixed (rye and wheat) breads. The most commonly used breads at the present time in the Polish Army are the "rembertow" and "pisk" mixed varieties. The purpose of the paper was to determine by actual testing and through a system of analytical designations the true value of a certain number of nutritional factors in mixed rye-wheat army bread. Test samples were taken from three military bakeries located in different regions of the country. Five 2-kg loaves were taken at random from different portions of a baking batch.

Card 1/2

ACC NR. AP6026290

Twenty-four hours after baking, sections from each loaf were removed and blended with similar sections from the remaining four loaves of the same test group. The test samples so obtained were checked for a total of 11 nutritional factors, including vitamins and minerals. Two tables are given illustrating the chemical composition of 100 of both types of army bread (rembertow and pisk). It was found that differences in the basic nutritional values in the bread types examined are not significant, although there are some divergencies in vitamin content. It also appears that differences in the same kind of bread, but obtained from different bakeries, are also negligible. Orig. art. has: 3 tables.

: Attempts at Finding the Factors in an Organism Which Increase the Height of a Polagegraphic Wave in the Blood

of Rats with Tumors.

Orig Pub : Howatwary, 1956, 6, Ho 4, 229-240

Abstract

: In 8 rats with Geren's ophitolism and in with sarsconn, the height of the polarographic wave (HFW) was determined in blood samples taken from various vessels, as well as from extract of connective tissue which surrounded the tunor and netastases. IIII was without significant variation in different blood samples, but in tumor extract-considerably increased. An increased HTW in artificially necrotized normal tissue as well as in necrotized and living

tissue of tumor itself, was not noted. A notable

charges of HFW was noted after addition of homeganates of liver from animal with a tumor to the blood of healthy animals. Apparently, the americase of HFW is not conditioned by the tissue of tumor riself, but is conditioned by charges in metabolism which occur in the organism and the appearance, in the liver, under the influence of a grow-ing tumor, of polaro raphically active substances. —— 3.Ya. Title

: Changes in the Relative Content of Nucleic Acids in the

Epidermis of Rats in Local Irradiation

Orig Pub

: Folia morphol., 1958, 9, No 1, 39-48

Abstract

: With the contact apparatus of Sholl the skin of the hip of white rats was irradiated and the intensity was studied of histochemical reactions to nucleic acids after 3, 6 and 2½ hours. DNA were discovered according to the method of Felgen, RNA according to the method of Brashe. The intensity of reactions was determined microphotometrically; the intensity of metachromasy beta by means of metachromatic index. Immediately after irradiation, the decrease of reactions to nucleic acids was noted; in subsequent
